This program uses the C# language. This program's goal is to monitor and adjust the inventory of a store. It keeps a record of the name, price, and current quantity of each item in the inventory. The program is able to search the inventory to find the quantity and current price of an item in the inventory. This program could be improved through the use of multiple forms and allowing data to be altered in each one. However, I am uncertain how to do such a thing at this time.
